The all built consist of four 3D printed parts:

- Snork.stl
- Capot.stl
- Enclosure_CO2.stl
- TTGO_T_Display_Front_V2.stl

The main body have been designed by Gristle King (https://github.com/meteoscientific/VO2max/wiki). Small adaptation has been implemented to be able to use a pressure sensor Sensirion SDP8xx.

On the other hand, the packaging for the electronic have been newly implemented. Inspired by the screen enclosure built by uzer66 (https://www.printables.com/model/119144-lilygo-ttgo-t-display-enclosure).

The part well prints in PLA using classic support material. The thread inserts are partially cut to be able to fit the hole depth. The Enclosure_CO2.stl is fixed using double side tap.

Chirurgical single used mask (cut to size) are used as filter in front of the CO_2 and O_2 Sensor to protect them from humidity. The first O_2 sensor died drowned in slime.
